OSCILLOTRON

NEW SOUNDS, OLD MACHINES

BRUTAL

ETHERIAL

CRYSTALLINE

WAVEFORMS

Oscillotron contains thousands of patches all made exclusively with analog synths like ARP 2500/2600/Odyssey, Aries, Emu, Motm, Modcan, Korg 700s, Sequential pro 1, Roland promars/Sh1/JP4 and Oberheim 4 voice and mammoth modulars.

All techniques known to man have been utilised in the making of this VSTi. That's why we say: new sounds from old machines. Oscillotron contains 28 000 samples, round robin variations and filter layers. This beast acts and behaves just like the real thing.

Oscillotron is available as VSTi and standalone. It has 2 multimode filters in series, with filters modelled from Moog and Oberheim, three envelopes, LFO's, overdrive and exciter, 7 modelled effects: Analog chorus, tape delay, spring reverb, frequency shifter, compressor, digital delay and a beautiful digital reverb. You also get an eight band master EQ and a master limiter. And, lastly, a step sequencer with analog functions that includes over 100 drum loops and 100 soundscapes.

This pdf outlines the three main categories (advanced sounds, drums and soundscapes) and gives a description on how it was made. If you need help or further info, please contact Roger Grønberg at www.Frodebeats.com

One important thing to notice about the drum loops and soundscapes provided as an extra in the step sequencer is that some of the sounds are BPM dependable due to the nature of the sounds.

ADVANCED SOUNDS

1. Lead	Patch name	Description
1	Edward Snowden	Modular FM mod
